# 1 Introduction

This Configuration Note describes how to set up the AudioCodes Enterprise Session Border Controller (hereafter, referred to as *SBC*) for interworking between Pyur's SIP Trunk and Microsoft's Teams Direct Routing environment.

You can also use AudioCodes' SBC Wizard tool to automatically configure the SBC based on this interoperability setup. However, it is recommended to read through this document to better understand the various configuration options. For more information on AudioCodes' SBC Wizard including the download option, visit AudioCodes Web site at <https://www.audiocodes.com/partners/sbc-interoperability-list>.

## 1.1 Intended Audience

This document is intended for engineers, or AudioCodes and Pyur partners who are responsible for installing and configuring Pyur's SIP Trunk and Microsoft's Teams Direct Routing Service in Enterprise Model for enabling VoIP calls using AudioCodes SBC.

## 1.2 About Microsoft Teams Direct Routing

Microsoft Teams Direct Routing allows connecting a customer-provided SBC to the Microsoft Phone System. The customer-provided SBC can be connected to almost any telephony trunk or connect with third-party PSTN equipment. The connection allows:

- Using virtually any PSTN trunk with Microsoft Phone System
- Configuring interoperability between customer-owned telephony equipment, such as third-party PBXs, analog devices, and Microsoft Phone System

## 1.3 About AudioCodes SBC Product Series

AudioCodes' family of SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware. The SBC can be offered as a Virtualized SBC, supporting the following platforms: Hyper-V, AWS, AZURE, AWP, KVM and VMWare.

## 2.4 Interoperability Test Topology

Microsoft Teams Direct Routing can be implemented in the *Enterprise* or *Hosting* Models.

### 2.4.1 Enterprise Model Implementation

The interoperability testing between AudioCodes SBC and Pyur SIP Trunk with Teams Direct Routing Enterprise Model was done using the following topology setup:

- Enterprise deployed with third-party IP-PBX, analog devices and the administrator's management station, located on the LAN
- Enterprise deployed with Microsoft Teams Phone System Direct Routing Interface located on the WAN for enhanced communication within the Enterprise
- Enterprise wishes to offer its employees enterprise-voice capabilities and to connect the Enterprise to the PSTN network using Pyur's SIP Trunking service
- AudioCodes SBC is implemented to interconnect between the SIP Trunk in the Enterprise LAN and Microsoft Teams on the WAN
  - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
  - **Border:** IP-to-IP network border - the Pyur's SIP Trunk is located in the Enterprise LAN (or WAN) and the Microsoft Teams Phone Systems is located in the public network.

The figure below illustrates this interoperability test topology:

**Figure 2-1: Interoperability Test Topology between SBC and Microsoft Teams Direct Routing Enterprise Model with Pyur SIP Trunk**

## 2.4.2 Environment Setup

The interoperability test topology includes the following environment setup:

**Table 2-4: Environment Setup**

| Area                         | Setup                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Network</b>               | <ul style="list-style-type: none"> <li>Both, Pyur SIP Trunk and Microsoft Teams Direct Routing environment are located on the Enterprise's (or Service Provider's) WAN</li> </ul>                                                         |
| <b>Signaling Transcoding</b> | <ul style="list-style-type: none"> <li>Microsoft Teams Direct Routing operates with SIP-over-TLS transport type</li> <li>Pyur SIP Trunk operates with SIP-over-TCP transport type</li> </ul>                                              |
| <b>Codecs Transcoding</b>    | <ul style="list-style-type: none"> <li>Microsoft Teams Direct Routing supports G.711A-law, G.711U-law, G.729, G.722 and SILK (NB and WB) coders</li> <li>Pyur SIP Trunk supports G.711A-law, G.711U-law, G.722 and OPUS coders</li> </ul> |
| <b>Media Transcoding</b>     | <ul style="list-style-type: none"> <li>Microsoft Teams Direct Routing operates with SRTP media type</li> <li>Pyur SIP Trunk operates with RTP media type</li> </ul>                                                                       |

## 2.4.3 Infrastructure Prerequisites

The table below shows the list of infrastructure prerequisites for deploying Microsoft Teams Direct Routing.

**Table 2-5: Infrastructure Prerequisites**

| Infrastructure Prerequisite                              | Details                                                        |
|----------------------------------------------------------|----------------------------------------------------------------|
| Certified Session Border Controller (SBC)                | See Microsoft's document <a href="#">Plan Direct Routing</a> . |
| SIP Trunks connected to the SBC                          |                                                                |
| Office 365 Tenant                                        |                                                                |
| Domains                                                  |                                                                |
| Public IP address for the SBC                            |                                                                |
| Fully Qualified Domain Name (FQDN) for the SBC           |                                                                |
| Public DNS entry for the SBC                             |                                                                |
| Public trusted certificate for the SBC                   |                                                                |
| Firewall ports for Direct Routing Signaling              |                                                                |
| Firewall IP addresses and ports for Direct Routing Media |                                                                |
| Media Transport Profile                                  |                                                                |
| Firewall ports for Teams Clients Media                   |                                                                |

## 2.4.4 Known Limitations

There were no limitations observed in the interoperability tests done for the AudioCodes SBC interworking between Microsoft Teams Direct Routing and Pyur's SIP Trunk. Presentation of the calling number during call forward and call transfer can be different due to variety in some carrier's configuration.

**This page is intentionally left blank.**

## 3 Configuring Teams Direct Routing

This section describes how to configure Microsoft Teams Direct Routing to operate with AudioCodes SBC.

### 3.1 Prerequisites

Before you begin configuration, make sure you have the following for every SBC you want to pair:

- Public IP address
- FQDN name matching SIP addresses of the users
- Public certificate, issued by one of the supported CAs

### 3.2 SBC Domain Name in the Teams Enterprise Model

The SBC domain name must be from one of the names registered in 'Domains' of the tenant. You cannot use the **\*.onmicrosoft.com** tenant for the domain name. For example, in Figure 3-1, the administrator registered the following DNS names for the tenant:

**Table 3-1: DNS Names Registered by an Administrator for a Tenant**

| DNS name                  | Can be used for SBC FQDN | Examples of FQDN names                                                                                                                                                                                                                                                                              |
|---------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACeducation.info          | Yes                      | <b>Valid names:</b> <ul style="list-style-type: none"> <li>■ sbc.ACeducation.info</li> <li>■ ussbcs15.ACeducation.info</li> <li>■ europe.ACeducation.info</li> </ul> <b>Invalid name:</b><br>sbc1.europe.ACeducation.info (requires registering domain name europe.atatum.biz in 'Domains' first)   |
| adatumbiz.onmicrosoft.com | No                       | Using <b>*.onmicrosoft.com</b> domains is not supported for SBC names                                                                                                                                                                                                                               |
| hybridvoice.org           | Yes                      | <b>Valid names:</b> <ul style="list-style-type: none"> <li>■ sbc1.hybridvoice.org</li> <li>■ ussbcs15.hybridvoice.org</li> <li>■ europe.hybridvoice.org</li> </ul> <b>Invalid name:</b><br>sbc1.europe.hybridvoice.org (requires registering domain name europe.hybridvoice.org in 'Domains' first) |

Users can be from any SIP domain registered for the tenant. For example, you can provide users [user@ACeducation.info](mailto:user@ACeducation.info) with the SBC FQDN **int-sbc1.audctrunk.aceducation.info** so long as both names are registered for this tenant.

**Figure 3-1: Example of Registered DNS Names**

During creation of the Domain, you will be forced to create public DNS record (**int-sbc1.audctrunk.aceducation.info** in our example.)

### 3.3 Example of the Office 365 Tenant Direct Routing Configuration

Configuration can be done using the web or with PowerShell. For the web, login to the Teams Admin Center (<https://admin.teams.microsoft.com>) with Tenant Administrator credentials.

**Figure 3-2: Teams Admin Center**

### 3.3.1 Add New SBC to Direct Routing

The procedure below describes how add a new SBC to Direct Routing.

➤ To add New SBC to Direct Routing:

1. In the web interface, select **Voice**, and then click **Direct Routing**.
2. Under SBCs click **Add**.

Figure 3-3: Add new SBC to Direct Routing

3. Configure SBC.

Figure 3-4: Configure new SBC

You can use the following PowerShell command for creating a new Online PSTN Gateway:

```
New-CsOnlinePSTNGateway -Identity int-sbc1.audctrunk.aceducation.info -SipSignalingPort 5061 -ForwardCallHistory $True -ForwardPai $True -MediaBypass $True -Enabled $True
```

**Note:** Currently, enabling MediaBypass is available only through PowerShell.

### 3.3.2 Add Voice Route and PSTN Usage

The procedure below describes how add a voice route and PSTN usage.

➤ **To add voice route and PSTN usage:**

4. In the web interface, under **Direct Routing**, select **Voice routes**, and then click **Add**.

**Figure 3-5: Add New Voice Route**

**Direct Routing**

Direct Routing lets you connect a supported Session Border Controller (SBC) to Microsoft Phone System to enable voice calling features. You can add, edit, and view information about your SBCs, voice routes, and PSTN usage records. [Learn more](#)

**Direct routing summary**

|            |              |                  |
|------------|--------------|------------------|
| 2          | 4            | 2                |
| Total SBCs | Voice routes | SBCs with issues |

**Voice routes**

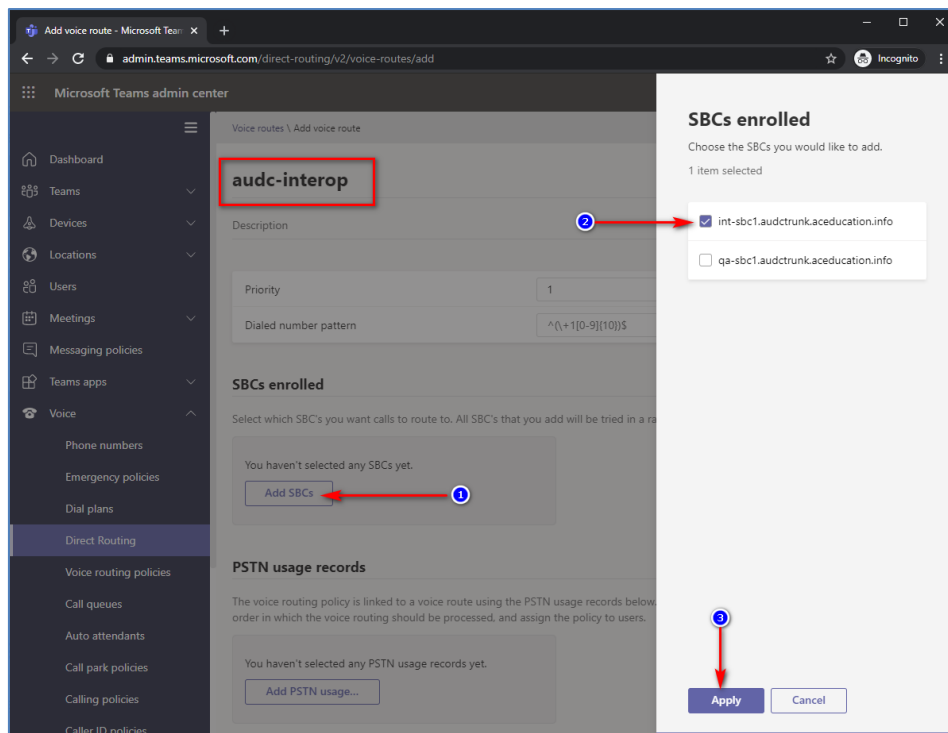

**+ Add** [Edit](#) [Move up](#) [Move down](#) [Delete](#) [Items](#)

| ✓ | Priority | Voice route   | Description  | Dialed number pattern | PSTN |
|---|----------|---------------|--------------|-----------------------|------|
|   | 1        | int-il        |              | ^\+                   | Inte |
|   | 2        | Israel        |              | ^\+972(\d{8})         | Isra |
|   | 3        | AC-SBCaaS-Any |              | \d+                   | SBC  |
|   | 4        | Test1         | Only Testing |                       |      |

[Need help?](#) [Give feedback](#)

5. Create a new Voice Route and associate it with the SBC, configured in the previous step.

**Figure 3-6: Associate SBC with new Voice Route**

6. Add new (or associate existing) PSTN usage.

**Figure 3-7: Associate PSTN Usage with New Voice Route**

The same operations can be done using following PowerShell commands:

7. Creating an empty PSTN Usage:

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="Interop"}
```

8. Creating new Online Voice Route and associating it with PSTN Usage:

```
New-CsOnlineVoiceRoute -Identity "audc-interop" -NumberPattern
"^\\+" -OnlinePstnGatewayList int-
sbc1.audctrunk.aceducation.info -Priority 1 -OnlinePstnUsages
"Interop"
```

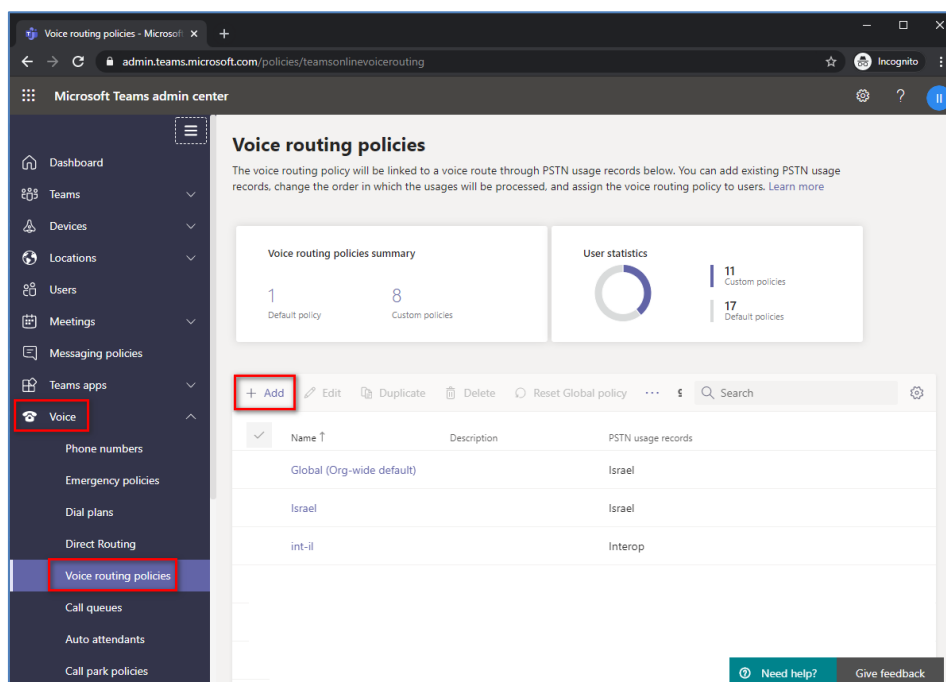

### 3.3.3 Add Voice Routing Policy

The procedure below describes how add a voice routing policy

➤ To add voice routing policy:

1. In the web interface, under **Voice**, select **Voice routing policies** and click **Add**.

Figure 3-8: Add New Voice Routing Policy

2. Create a new Voice Routing Policy and associate it with PSTN Usage, configured in the previous step.

**Figure 3-9: Associate PSTN Usage with New Voice Routing Policy**

The same operations can be done using following PowerShell command:

```
New-CsOnlineVoiceRoutingPolicy "audc-interop" -OnlinePstnUsages "Interop"
```

**Note:** The commands specified in Sections 3.3.4 and 3.3.5, should be run **for each** Teams user in the company tenant. They are currently available through PowerShell **only**.

### 3.3.4 Enable Online User

Use the following PowerShell command for enabling online user:

```
Set-CsUser -Identity user1@company.com -EnterpriseVoiceEnabled $true -HostedVoiceMail $true -OnPremLineURI tel:+12345678901
```

### 3.3.5 Assigning Online User to the Voice Routing Policy

Use following PowerShell command for assigning online user to the Voice Route:

```
Grant-CsOnlineVoiceRoutingPolicy -PolicyName "audc-interop" -Identity user1@company.com
```

## 4 Configuring AudioCodes SBC

This section provides step-by-step procedures on how to configure AudioCodes SBC for interworking between Microsoft Teams Direct Routing and the Pyur SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and includes the following main areas:

- SBC LAN interface – Management Station
- SBC WAN interface - Pyur SIP Trunking and Teams Direct Routing environment

This configuration is done using the SBC's embedded Web server (hereafter, referred to as *Web interface*).

### Notes:

- For implementing Microsoft Teams Direct Routing and Pyur SIP Trunk based on the configuration described in this section, AudioCodes SBC must be installed with a License Key that includes the following software features:
  - **MSFT** (general Microsoft license)  
Note: By default, all AudioCodes media gateways and SBCs are shipped with this license (except MSBR products, Mediant 500 SBC, and Mediant 500 Media Gateway).
  - **SW/TEAMS** (Microsoft Teams license)
  - **Number of SBC sessions** (based on requirements)
  - **Transcoding sessions** (only if media transcoding is needed)
  - **Coders** (based on requirements)For more information about the License Key, contact your AudioCodes sales representative.
- If your SBC is deployed in a virtual environment and transcoding is required, your virtual machine must have a minimum of two vCPUs. For more information, please refer to the appropriate *Installation Manual*, which can be found on AudioCodes website.
- The scope of this document does **not** cover all security aspects for configuring this topology. Comprehensive security measures should be implemented per your organization's security policies. For security recommendations on AudioCodes' products, refer to the *Recommended Security Guidelines* document, which can be found at AudioCodes web site

## 4.1 SBC Configuration Concept in Teams Direct Routing Enterprise Model

The diagram below represents AudioCodes' device configuration concept in the Enterprise Model.

**Figure 4-1: SBC Configuration Concept**

## 4.2 IP Network Interfaces Configuration

This section describes how to configure the SBC's IP network interfaces. There are several ways to deploy the SBC; however, this interoperability test topology employs the following deployment method:

- SBC interfaces with the following IP entities:
  - Management Servers located on the LAN.
  - Microsoft Teams Direct Routing and Pyur SIP Trunk, located on the WAN.
- SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection depends on the method used to connect to the Enterprise's network. In the interoperability test topology, SBC connects to the LAN and DMZ using dedicated ethernet ports (i.e., two ports and two network cables are used).
- SBC also uses two logical network interfaces:
  - LAN (VLAN ID 1)
  - DMZ (VLAN ID 2)

**Figure 4-2: Network Interfaces in Interoperability Test Topology**

### 4.2.1 Configure VLANs

This section describes how to configure VLANs for each of the following interfaces:

- LAN (assigned the name "LAN\_IF")
- WAN (assigned the name "WAN\_IF")

➤ **To configure the VLANs:**

1. Open the Ethernet Device table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **Ethernet Devices**).
2. There will be one existing row for VLAN ID 1 and underlying interface GROUP\_1.
3. Add another VLAN ID 2 for the WAN side

**Figure 4-3: Configured VLAN IDs in Ethernet Device**

| Ethernet Devices (2)                                                                                                |         |                      |        |          |
|---------------------------------------------------------------------------------------------------------------------|---------|----------------------|--------|----------|
| <div> <span>+ New</span> <span>Edit</span> <span>🗑️</span> </div> <div> Page 1 of 1 Show 10 records per page </div> |         |                      |        |          |
| INDEX                                                                                                               | VLAN ID | UNDERLYING INTERFACE | NAME   | TAGGING  |
| 0                                                                                                                   | 1       | GROUP_1              | vlan 1 | Untagged |
| 1                                                                                                                   | 2       | GROUP_2              | vlan 2 | Untagged |

### 4.2.2 Configure Network Interfaces

This section describes how to configure the IP network interfaces for each of the following interfaces:

- LAN Interface (assigned the name "LAN\_IF")
- WAN Interface (assigned the name "WAN\_IF")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **IP Interfaces**).
2. Configure the IP interfaces as follows (your network parameters might be different):

**Table 4-1: Configuration Example of the Network Interface Table**

| Index | Application Types                                                                            | Interface Mode | IP Address                              | Prefix Length | Gateway                               | DNS                                                | I/F Name | Ethernet Device |
|-------|----------------------------------------------------------------------------------------------|----------------|-----------------------------------------|---------------|---------------------------------------|----------------------------------------------------|----------|-----------------|
| 0     | OAMP+ Media + Control                                                                        | IPv4 Manual    | 10.15.77.55                             | 16            | 10.15.0.1                             | 10.15.27.1                                         | LAN_IF   | vlan 1          |
| 1     | Media + Control (as this interface points to the internet, enabling OAMP is not recommended) | IPv4 Manual    | 195.189.192.156 (DMZ IP address of SBC) | 25            | 195.189.192.129 (router's IP address) | According to your Internet provider's instructions | WAN_IF   | vlan 2          |

The configured IP network interfaces are shown below:

**Figure 4-4: Configured Network Interfaces in IP Interfaces Table**

| 0     | LAN_IF | OAMP + Media +   | IPv4 Manual    | 10.15.77.55     | 16            | 10.15.0.1       | 10.15.27.1  |               | vlan 1          |
| 1     | WAN_IF | Media + Control  | IPv4 Manual    | 195.189.192.156 | 24            | 195.189.192.129 | 8.8.8.8     | 80.179.55.100 | vlan 2          |

## 4.3 SIP TLS Connection Configuration

This section describes how to configure the SBC for using a TLS connection with the Microsoft Teams Direct Routing Phone System. This configuration is essential for a secure SIP TLS connection. The configuration instructions in this section are based on the following domain structure that must be implemented as part of the certificate which must be loaded to the host SBC:

- CN: int-sbc1.audctrunk.aceducation.info
- SAN: int-sbc1.audctrunk.aceducation.info

This certificate module is based on the Service Provider's own TLS Certificate. For more certificate structure options, see Microsoft Teams Direct Routing documentation.

The Microsoft Phone System Direct Routing Interface allows **only** TLS connections from SBCs for SIP traffic with a certificate signed by one of the Trusted Certification Authorities.

Currently, supported Certification Authorities can be found in the following link:

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-plan#public-trusted-certificate-for-the-sbc>

### 4.3.1 Configure the NTP Server Address

This section describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or another global server) to ensure that the SBC receives the current date and time. This is necessary for validating certificates of remote parties. It is important, that NTP Server will locate on the OAMP IP Interface (LAN\_IF in our case) or will be accessible through it.

➤ **To configure the NTP server address:**

1. Open the Time & Date page (**Setup** menu > **Administration** tab > **Time & Date**).
2. In the 'Primary NTP Server Address' field, enter the IP address of the NTP server (e.g., **10.15.27.1**).

**Figure 4-5: Configuring NTP Server Address**

| NTP SERVER                                |                      |
|-------------------------------------------|----------------------|
| Enable NTP                                | Enable               |
| Primary NTP Server Address (IP or FQDN)   | 10.15.27.1           |
| Secondary NTP Server Address (IP or FQDN) |                      |
| NTP Update Interval                       | Hours: 24 Minutes: 0 |
| NTP Authentication Key Identifier         | 0                    |
| NTP Authentication Secret Key             |                      |

3. Click **Apply**.

## 4.3.2 Create a TLS Context for Teams Direct Routing

This section describes how to configure TLS Context in the SBC. AudioCodes recommends implementing only TLS to avoid flaws in SSL.

➤ **To configure the TLS version:**

1. Open the TLS Contexts table (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. Create a new TLS Context by clicking **New** at the top of the interface, and then configure the parameters using the table below as reference:

**Table 4-2: New TLS Context**

| Index                                                                 | Name                               | TLS Version |
|-----------------------------------------------------------------------|------------------------------------|-------------|
| 1                                                                     | Teams (arbitrary descriptive name) | TLSv1.2     |
| All other parameters can be left unchanged with their default values. |                                    |             |

**Note:** The table above exemplifies configuration focusing on interconnecting SIP and media. You might want to configure additional parameters according to your company's policies. For example, you might want to configure Online Certificate Status Protocol (OCSP) to check if SBC certificates presented in the online server are still valid or revoked. For more information on the SBC's configuration, see the *User's Manual*, available for download from <https://www.audiocodes.com/library/technical-documents>.

**Figure 4-6: Configuring TLS Context for Teams Direct Routing**

3. Click **Apply**.

### 4.3.3 Configure a Certificate

This section describes how to request a certificate for the SBC and to configure it based on the example of DigiCert Global Root CA. The certificate is used by the SBC to authenticate the connection with Microsoft Teams Direct Routing.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR).
- b. Requesting Device Certificate from CA.
- c. Obtaining Trusted Root/ Intermediate Certificate from CA.
- d. Deploying Device and Trusted Root/ Intermediate Certificates on SBC.

➤ **To configure a certificate:**

1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
3. Under the **Certificate Signing Request** group, do the following:
  - a. In the 'Subject Name [CN]' field, enter the SBC FQDN name (based on example above, **int-sbc1.audctrunk.aceducation.info**).
  - b. In the '1<sup>st</sup> Subject Alternative Name [SAN]' field, change the type to 'DNS' and enter the SBC FQDN name (based on example above, **int-sbc1.audctrunk.aceducation.info**).

**Note:** The domain portion of the Common Name [CN] and 1st Subject Alternative Name [SAN] must match the SIP suffix configured for Office 365 users.

- c. Change the 'Private Key Size' based on the requirements of your Certification Authority. Many CAs do not support private key of size 1024.
- d. To change the key size on TLS Context, go to: **Generate New Private Key**, change the 'Private Key Size' to the value required by your CA and then click **Generate Private-Key**. To use **2048** as a Private Key Size value, you can click **Generate Private-Key** without changing the default key size value.
- e. Fill in the rest of the request fields according to your security provider's instructions.
- f. Click the **Create CSR** button; a textual certificate signing request is displayed in the area below the button:

TLS Context [#1] > Change Certificates

CERTIFICATE SIGNING REQUEST

Common Name [CN]

int-sbc1.audctrunk.aceducation.info

Organizational Unit [OU] (optional)

Company name [O] (optional)

Locality or city name [L] (optional)

State [ST] (optional)

Country code [C] (optional)

1st Subject Alternative Name [SAN]

DNS int-sbc1.audctrunk.aceducation.info

2nd Subject Alternative Name [SAN]

EMAIL

3rd Subject Alternative Name [SAN]

EMAIL

4th Subject Alternative Name [SAN]

EMAIL

5th Subject Alternative Name [SAN]

EMAIL

Signature Algorithm

SHA-256

Press the "Generate Self-Signed Certificate" button to create self-signed certificate.  
Note that the certificate will use the subject name configured in "Certificate Signing Request" box.

Generate Self-Signed Certificate

Create CSR

After creating the CSR, copy the text below (including the BEGIN/END lines) and send it to your Certification Authority for signing.

-----BEGIN CERTIFICATE REQUEST-----  
MIICtDCAZwCAQwwLjEsMCoGA1UEAwijahV5S0LNiYzEuYXVkyY3RydWl5rLmFjZiNrI

pRSJw21C880hjIFZgOC+0oxCIva8HOEJ  
-----END CERTIFICATE REQUEST-----

GENERATE NEW PRIVATE KEY

Private Key Size

2048

Press the "Generate Private Key" button to create new private key.  
**Important:** generation of private key is a lengthy operation during which the device service may be affected.

Generate Private-Key

4. Copy the CSR from the line **"----BEGIN CERTIFICATE REQUEST----"** to a text file (such as Notepad), and then save it to a folder on your computer with the file name, for example *certreq.txt*.
5. Send *certreq.txt* file to the Certified Authority Administrator for signing.

6. After obtaining an SBC signed and Trusted Root/Intermediate Certificate from the CA, in the SBC's Web interface, return to the **TLS Contexts** page and do the following:
  - a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
  - b. Scroll down to the **Upload certificates files from your computer** group, click the **Choose File** button corresponding to the 'Send Device Certificate...' field, navigate to the certificate file obtained from the CA, and then click **Load File** to upload the certificate to the SBC.

**Figure 4-8: Uploading the Certificate Obtained from the Certification Authority**

UPLOAD CERTIFICATE FILES FROM YOUR COMPUTER

Private key pass-phrase (optional)

Send **Private Key** file from your computer to the device.  
The file must be in either PEM or PFX (PKCS#12) format.

No file chosen

Note: Replacing the private key is not recommended but if it's done, it should be over a physically-secure network link.

Send **Device Certificate** file from your computer to the device.  
The file must be in textual PEM format.

No file chosen  ←

7. Confirm that the certificate was uploaded correctly. A message indicating that the certificate was uploaded successfully is displayed in blue in the lower part of the page.
8. In the SBC's Web interface, return to the **TLS Contexts** page, select the required TLS Context index row, and then click the **Certificate Information** link, located at the bottom of the TLS. Then validate the Key size, certificate status and Subject Name:

**Figure 4-9: Certificate Information Example**

⬅️ TLS Context [#1] > Certificate Information

PRIVATE KEY

Key size: 2048 bits

Status: OK

CERTIFICATE

Certificate:

Data:

Version: 3 (0x2)

Serial Number: 45:be:53:11:ad:89:63:80:3b:ab:14:5e:34:34:57:53

Issuer: C=IL, O=Domain The Net Technologies Ltd, CN=Domain The Net Technologies Ltd CA for SSL R2

Validity

Not Before: May 4 14:24:51 2020 GMT

Not After: May 4 14:24:51 2022 GMT

Subject: CN= int-sbc1.audctrunk.aceducation.info

Subject Public Key Info:

Public Key Algorithm: rsaEncryption

RSA Public-Key: (2048 bit)

9. In the SBC's Web interface, return to the **TLS Contexts** page.
  - a. In the TLS Contexts page, select the required TLS Context index row, and then click the **Trusted Root Certificates** link, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.
  - b. Click the **Import** button, and then select all Root/Intermediate Certificates obtained from your Certification Authority to load.
10. Click **OK**; the certificate is loaded to the device and listed in the Trusted Certificates store:

**Figure 4-10: Example of Configured Trusted Root Certificates**

| <a href="#">←</a> TLS Context [#2] > Trusted Root Certificates |                         |                         |            |
|----------------------------------------------------------------|-------------------------|-------------------------|------------|
| View                                                           |                         | Import Export Remove    |            |
| INDEX                                                          | SUBJECT                 | ISSUER                  | EXPIRES    |
| 0                                                              | DigiCert Global Root CA | DigiCert Global Root CA | 11/10/2031 |
| 1                                                              | RapidSSL RSA CA 2018    | DigiCert Global Root CA | 11/06/2027 |

### 4.3.4 Method of Generating and Installing the Wildcard Certificate

To use the same certificate on multiple devices, you may prefer using 3<sup>rd</sup> party application (e.g. [DigiCert Certificate Utility for Windows](#)) to process the certificate request from your Certificate Authority on another machine, with this utility installed.

After you've processed the certificate request and response using the DigiCert utility, test the certificate private key and chain and then export the certificate with private key and assign a password.

➤ **To install the certificate:**

1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
3. Scroll down to the **Upload certificates files from your computer** group and do the following:
  - a. Enter the password assigned during export with the DigiCert utility in the **'Private key pass-phrase'** field.
  - b. Click the **Choose File** button corresponding to the 'Send **Private Key**...' field and then select the SBC certificate file exported from the DigiCert utility.

### 4.3.5 Deploy Baltimore Trusted Root Certificate

The DNS name of the Microsoft Teams Direct Routing interface is **sip.pstnhub.microsoft.com**. In this interface, a certificate is presented which is signed by Baltimore Cyber Baltimore CyberTrust Root with Serial Number: 02 00 00 b9 and SHA fingerprint: d4:de:20:d0:5e:66:fc: 53:fe:1a:50:88:2c:78:db:28:52:ca:e4:74.

To trust this certificate, your SBC *must* have the certificate in Trusted Certificates storage. Download the certificate from <https://cacert.omniroot.com/bc2025.pem> and follow the steps above to import the certificate to the Trusted Root storage.

**Note:** Before importing the Baltimore Root Certificate into AudioCodes' SBC, make sure it's in .PEM or .PFX format. If it isn't, you need to convert it to .PEM or .PFX format. Otherwise, you will receive a 'Failed to load new certificate' error message. To convert to PEM format, use the Windows local store on any Windows OS and then export it as 'Base-64 encoded X.509 (.CER) certificate'.

## 4.4 Configure Media Realms

This section describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for the SIP Trunk traffic and one for the Teams traffic.

➤ **To configure Media Realms:**

1. Open the Media Realms table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Media Realms**).
2. Configure Media Realms as follows (you can use the default Media Realm (Index 0), but modify it):

**Table 4-3: Configuration Example Media Realms in Media Realm Table**

| Index | Name                      | Topology Location | IPv4 Interface Name | Port Range Start | Number of Media Session Legs                  |
|-------|---------------------------|-------------------|---------------------|------------------|-----------------------------------------------|
| 0     | SIPTrunk (arbitrary name) |                   | WAN_IF              | 6000             | 100 (media sessions assigned with port range) |
| 1     | Teams (arbitrary name)    | Up                | WAN_IF              | 7000             | 100 (media sessions assigned with port range) |

The configured Media Realms are shown in the figure below:

**Figure 4-11: Configured Media Realms in Media Realm Table**

| Media Realms (2)                                                                                           |          |                     |                      |                              |                    |                     |
|------------------------------------------------------------------------------------------------------------|----------|---------------------|----------------------|------------------------------|--------------------|---------------------|
| <div> <div>+ New Edit</div> <div> <div>Page 1 of 1</div> <div>Show 10 records per page</div> </div> </div> |          |                     |                      |                              |                    |                     |
| INDEX                                                                                                      | NAME     | IPv4 INTERFACE NAME | UDP PORT RANGE START | NUMBER OF MEDIA SESSION LEGS | UDP PORT RANGE END | DEFAULT MEDIA REALM |
| 0                                                                                                          | SIPTrunk | WAN_IF              | 6000                 | 100                          | 6999               | No                  |
| 1                                                                                                          | Teams    | WAN_IF              | 7000                 | 100                          | 7999               | No                  |

## 4.5 Configure SIP Signaling Interfaces

This section describes how to configure SIP Interfaces. For the interoperability test topology, towards the SIP Trunk and towards the Teams Direct Routing SIP Interfaces must be configured for the SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interfaces table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **SIP Interfaces**).
2. Configure SIP Interfaces. You can use the default SIP Interface (Index 0), but modify it as shown in the table below. The table below shows an example of the configuration. You can change some parameters according to your requirements.

**Note:** The Direct Routing interface can only use TLS for a SIP port. It does not support using TCP due to security reasons. The SIP port might be any port of your choice. When pairing the SBC with Office 365, the chosen port is specified in the pairing command.

**Table 4-4: Configured SIP Interfaces in SIP Interface Table**

| Index | Name                      | Network Interface | Application Type | UDP Port                                         | TCP Port | TLS Port                               | Enable TCP Keepalive          | Classification Failure Response Type   | Media Realm |
|-------|---------------------------|-------------------|------------------|--------------------------------------------------|----------|----------------------------------------|-------------------------------|----------------------------------------|-------------|
| 0     | SIPTrunk (arbitrary name) | WAN_IF            | SBC              | 5060 (according to Service Provider requirement) | 5060     | 0                                      | Disable (leave default value) | 0 (Recommended to prevent DoS attacks) | SIPTrunk    |
| 1     | Teams (arbitrary name)    | WAN_IF            | SBC              | 0                                                | 0        | 5061 (as configured in the Office 365) | Enable                        | 0 (Recommended to prevent DoS attacks) | Teams       |

The configured SIP Interfaces are shown in the figure below:

**Figure 4-12: Configured SIP Interfaces in SIP Interface Table**

| SIP Interfaces (2) |          |               |                   |                  |          |                          |          |                        |             |
|--------------------|----------|---------------|-------------------|------------------|----------|--------------------------|----------|------------------------|-------------|
| + New Edit         |          |               |                   | Page 1 of 1      |          | Show 10 records per page |          |                        |             |
| INDEX              | NAME     | SRD           | NETWORK INTERFACE | APPLICATION TYPE | UDP PORT | TCP PORT                 | TLS PORT | ENCAPSULATING PROTOCOL | MEDIA REALM |
| 0                  | SIPTrunk | DefaultSRD (# | WAN_IF            | SBC              | 5060     | 5060                     | 0        | No encapsulation       | SIPTrunk    |
| 1                  | Teams    | DefaultSRD (# | WAN_IF            | SBC              | 0        | 0                        | 5061     | No encapsulation       | Teams       |

## 4.6 Configure Proxy Sets and Proxy Address

This section describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Pyur SIP Trunk
- Teams Direct Routing

The Proxy Sets will later be applied to the VoIP network by assigning them to IP Groups.

### ➤ To configure Proxy Sets:

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Proxy Sets**).
2. Configure Proxy Sets as shown in the table below:

**Table 4-5: Configuration Example Proxy Sets in Proxy Sets Table**

| Index | Name                      | SBC IPv4 SIP Interface | TLS Context Name | Proxy Keep-Alive | Proxy Hot Swap | Proxy Load Balancing Method |
|-------|---------------------------|------------------------|------------------|------------------|----------------|-----------------------------|
| 1     | Pyur<br>(arbitrary name)  | SIPTrunk               | Default          | Using Options    | Disable        | Disable                     |
| 2     | Teams<br>(arbitrary name) | Teams                  | Teams            | Using Options    | Enable         | Random Weights              |

The configured Proxy Sets are shown in the figure below:

**Figure 4-13: Configured Proxy Sets in Proxy Sets Table**

| Proxy Sets (3) |            |                 |                            |                        |                             |                          |                |
|----------------|------------|-----------------|----------------------------|------------------------|-----------------------------|--------------------------|----------------|
| + New Edit     |            |                 |                            | Page 1 of 1            |                             | Show 10 records per page |                |
| INDEX          | NAME       | SRD             | GATEWAY IPV4 SIP INTERFACE | SBC IPV4 SIP INTERFACE | PROXY KEEP-ALIVE TIME [SEC] | REDUNDANCY MODE          | PROXY HOT SWAP |
| 0              | ProxySet_0 | DefaultSRD (#0) | --                         | SIPTrunk               | 60                          |                          | Disable        |
| 1              | Pyur       | DefaultSRD (#0) | --                         | SIPTrunk               | 60                          |                          | Disable        |
| 2              | Teams      | DefaultSRD (#0) | --                         | Teams                  | 60                          |                          | Enable         |

## 4.6.1 Configure a Proxy Address

This section shows how to configure a Proxy Address.

➤ **To configure a Proxy Address for SIP Trunk:**

1. Open the Proxy Sets table (Setup menu > Signaling & Media tab > Core Entities folder > Proxy Sets) and then click the Proxy Set **Pyur**, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
2. Click **+New** and configure the address of the Proxy Set according to the parameters described in the table below:

**Table 4-6: Configuration Proxy Addresses for SIP Trunk**

| Index | Proxy Address                                            | Transport Type | Proxy Priority | Proxy Random Weight |
|-------|----------------------------------------------------------|----------------|----------------|---------------------|
| 0     | sipaccount.pyur.tel:5060<br>(SIP Trunk FQDN/IP and port) | UDP            | 0              | 0                   |

3. Click **Apply**.

**Figure 4-14: Configured Proxy Addresses for SIP Trunk**

The screenshot shows a window titled "Proxy Address" with a dark blue header bar containing a minus sign and a close button. Below the header is a light gray bar labeled "GENERAL". The configuration fields are as follows:

|                     |                                                       |
|---------------------|-------------------------------------------------------|
| Index               | <input type="text" value="0"/>                        |
| Proxy Address       | <input type="text" value="sipaccount.pyur.tel:5060"/> |
| Transport Type      | <input type="text" value="UDP"/>                      |

➤ **To configure a Proxy Address for Teams:**

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Proxy Sets**) and then click the Proxy Set **Teams**, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
2. Click **+New** and configure the address of the Proxy Set according to the parameters described in the table below:

**Table 4-7: Configuration Proxy Address for Teams Direct Routing**

| Index | Proxy Address                   | Transport Type | Proxy Priority | Proxy Random Weight |
|-------|---------------------------------|----------------|----------------|---------------------|
| 0     | sip.pstnhub.microsoft.com:5061  | TLS            | 1              | 1                   |
| 1     | sip2.pstnhub.microsoft.com:5061 | TLS            | 2              | 1                   |
| 2     | sip3.pstnhub.microsoft.com:5061 | TLS            | 3              | 1                   |

3. Click **Apply**.

## 4.7 Configure Coders

This section describes how to configure coders (termed *Coder Group*). As Microsoft Teams Direct Routing supports the SILK and OPUS coders while the network connection to Pyur SIP Trunk may restrict operation with a dedicated coders list, you need to add a Coder Group with the supported coders for each leg, the Microsoft Teams Direct Routing and the Pyur SIP Trunk.

Note that the Coder Group ID for this entity will be assigned to its corresponding IP Profile in the next step.

➤ **To configure coders:**

1. Open the Coder Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Coder Groups**).
2. Configure a Coder Group for Microsoft Teams Direct Routing:

| Parameter        | Value                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Coder Group Name | <b>AudioCodersGroups_1</b>                                                                                                                                                       |
| Coder Name       | <ul style="list-style-type: none"> <li>▪ <b>SILK-NB</b></li> <li>▪ <b>SILK-WB</b></li> <li>▪ <b>G.711 A-law</b></li> <li>▪ <b>G.711 U-law</b></li> <li>▪ <b>G.729</b></li> </ul> |

**Figure 4-16: Configuring Coder Group for Microsoft Teams Direct Routing**

Coder Groups

Coder Group Name: 1 : AudioCodersGroups\_1 ▼ Delete Group

| Coder Name   | Packetization Time | Rate | Payload Type | Silence Suppression | Coder Specific |
|--------------|--------------------|------|--------------|---------------------|----------------|
| SILK-NB ▼    | 20 ▼               | 8 ▼  | 103          | N/A ▼               |                |
| SILK-WB ▼    | 20 ▼               | 16 ▼ | 104          | N/A ▼               |                |
| G.711A-law ▼ | 20 ▼               | 64 ▼ | 8            | Disabled ▼          |                |
| G.711U-law ▼ | 20 ▼               | 64 ▼ | 0            | Disabled ▼          |                |
| G.729 ▼      | 20 ▼               | 8 ▼  | 18           | Disabled ▼          |                |
| ▼            | ▼                  | ▼    |              | ▼                   |                |

3. Click **Apply**, and then confirm the configuration change in the prompt that pops up.

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Pyur SIP Trunk uses the dedicated coders list whenever possible. Note that this Allowed Coders Group ID will be assigned to the IP Profile belonging to the Pyur SIP Trunk in the next step.

➤ **To set a preferred coder for the Pyur SIP Trunk:**

1. Open the Allowed Audio Coders Groups table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **Allowed Audio Coders Groups**).
2. Click **New** and configure a name for the Allowed Audio Coders Group for Pyur SIP Trunk.

**Figure 4-17: Configuring Allowed Coders Group for Pyur SIP Trunk**

Allowed Audio Coders Groups [Pyur Allowed Coders]

GENERAL

Index: 0

Name: • Pyur Allowed Coders

3. Click **Apply**.
4. Select the new row that you configured, and then click the **Allowed Audio Coders** link located below the table; the Allowed Audio Coders table opens.
5. Click **New** and configure an Allowed Coders as follows:

| Parameter | Value                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------|
| Index     | 0                                                                                                                       |

7. From the '**Preferences Mode**' drop-down list, select **Include Extensions**.
8. Click **Apply**.

## 4.8 Configure IP Profiles

This section describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Pyur SIP trunk – to operate in non-secure mode using RTP and SIP over UDP
- Microsoft Teams Direct Routing – to operate in secure mode using SRTP and SIP over TLS

### ➤ To configure an IP Profile for the Pyur SIP Trunk:

1. Open the IP Profiles table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **IP Profiles**).
2. Click **New**, and then configure the parameters as follows:

| Parameter                       | Value                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>General</b>                  |                                                                                                               |
| Index                           | <b>1</b>                                                                                                      |
| Name                            | <b>Pyur</b>                                                                                                   |
| <b>Media Security</b>           |                                                                                                               |
| SBC Media Security Mode         | <b>Not Secured</b>                                                                                            |
| <b>SBC Media</b>                |                                                                                                               |

## 4.9 Configure IP Groups

This section describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Pyur SIP Trunk located on WAN
- Teams Direct Routing located on WAN

➤ **To configure IP Groups:**

1. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
2. Configure an IP Group for the Pyur SIP Trunk:

| Parameter                                | Value                                                      |
|------------------------------------------|------------------------------------------------------------|
| Index                                    | <b>1</b>                                                   |
| Name                                     | <b>Pyur</b>                                                |
| Type                                     | <b>Server</b>                                              |
| Proxy Set                                | <b>Pyur</b>                                                |
| IP Profile                               | <b>Pyur</b>                                                |
| Media Realm                              | <b>SIPTrunk</b>                                            |
| SIP Group Name                           | <b>sipaccount.pyur.tel</b> (according to ITSP requirement) |
| Proxy Keep-Alive using IP Group settings | <b>Enable</b>                                              |

3. Configure an IP Group for the Microsoft Teams Direct Routing:

| Parameter              | Value                                                                                                                      |
|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Index                  | <b>2</b>                                                                                                                   |
| Name                   | <b>Teams</b>                                                                                                               |
| Topology Location      | <b>Up</b>                                                                                                                  |
| Type                   | <b>Server</b>                                                                                                              |
| Proxy Set              | <b>Teams</b>                                                                                                               |
| IP Profile             | <b>Teams</b>                                                                                                               |
| Media Realm            | <b>Teams</b>                                                                                                               |
| SIP Group Name         | <b>sipaccount.pyur.tel</b> (according to ITSP requirement)                                                                 |
| Classify By Proxy Set  | <b>Disable</b>                                                                                                             |
| Local Host Name        | <b>&lt; FQDN name of your SBC in the Microsoft Teams tenant &gt;</b><br>(For example, int-sbc1.audctrunk.aceducation.info) |
| Always Use Src Address | <b>Yes</b>                                                                                                                 |

|                                          |               |
|------------------------------------------|---------------|
| Proxy Keep-Alive using IP Group settings | <b>Enable</b> |
|------------------------------------------|---------------|

The configured IP Groups are shown in the figure below:

**Figure 4-22: Configured IP Groups in IP Group Table**

## 4.10 Configure SRTP

This section describes how to configure media security. The Direct Routing Interface needs to use of SRTP only, so you need to configure the SBC to operate in the same manner.

### ➤ To configure media security:

1. Open the Media Security page (**Setup menu > Signaling & Media tab > Media folder > Media Security**).
2. From the 'Media Security' drop-down list, select **Enable** to enable SRTP.

**Figure 4-23: Configuring SRTP**

MASTER KEY IDENTIFIER

Master Key Identifier (MKI) Size

Symmetric MKI

3. Click **Apply**.

## 4.11 Configuring Message Condition Rules

This section describes how to configure the Message Condition Rules. A Message Condition defines special conditions (pre-requisites) for incoming SIP messages. These rules can be used as additional matching criteria for the IP-to-IP routing rules in the IP-to-IP Routing table. The following condition verifies that the Contact header contains Microsoft Teams FQDN.

➤ **To configure a Message Condition rule:**

1. Open the Message Conditions table (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Conditions**).
2. Click **New**, and then configure the parameters as follows:

| Parameter | Value                                                    |
|-----------|----------------------------------------------------------|
| Index     | 0                                                        |
| Name      | Teams-Contact (arbitrary descriptive name)               |
| Condition | Header.Contact.URL.Host contains 'pstnhub.microsoft.com' |

Figure 4-24: Configuring Condition Table

The screenshot shows a web interface window titled "Message Conditions [Teams-Contact]". Inside, there is a "GENERAL" tab. Under this tab, there are three configuration fields: "Index" with a text input containing "0", "Name" with a dropdown menu showing "Teams-Contact", and "Condition" with a dropdown menu showing "Header.Contact.URL.Host contains 'pstnhub.microsoft.com'". To the right of the "Condition" dropdown is a blue "Editor" link. The window has standard minimize and maximize buttons in the top right corner.

3. Click **Apply**.

## 4.12 Configuring Classification Rules

This section describes how to configure Classification rules. A Classification rule classifies incoming SIP dialog-initiating requests (e.g., INVITE messages) to a 'source' IP Group. The source IP Group is the SIP entity that sent the SIP dialog request. Once classified, the device uses the IP Group to process the call (manipulation and routing).

You can also use the Classification table for employing SIP-level access control for successfully classified calls, by configuring Classification rules with whitelist and blacklist settings. If a Classification rule is configured as a whitelist ("Allow"), the device accepts the SIP dialog and processes the call. If the Classification rule is configured as a blacklist ("Deny"), the device rejects the SIP dialog.

➤ **To configure a Classification rule:**

1. Open the Classification table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Classification Table**).
2. Click **New**, and then configure the parameters as follows:

| Parameter            | Value                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------|
| Index                | 0                                                                                                   |
| Name                 | Teams                                                                                               |
| Source SIP Interface | Teams                                                                                               |
| Source IP Address    | 52.114.*.*                                                                                          |
| Destination Host     | < FQDN name of your SBC in the Microsoft Teams tenant > (e.g., int-sbc1.audctrunk.aceducation.info) |
| Message Condition    | Teams-Contact                                                                                       |
| Action Type          | Allow                                                                                               |
| Source IP Group      | Teams                                                                                               |

Figure 4-25: Configuring Classification Rule

The screenshot shows the 'Classification [Teams]' configuration window. At the top, there's a tab for 'SRD' and a dropdown for '#0 [DefaultSRD]'. The main area is divided into two columns: 'MATCH' and 'ACTION'.

**MATCH Column:**

- Index: 0
- Name: Teams
- Source SIP Interface: #1 [Teams]
- Source IP Address: 52.114.\*.\*
- Source Transport Type: Any
- Source Port: 0
- Source Username Pattern: \*
- Source Host: \*
- Destination Username Pattern: \*
- Destination Host: int-sbc1.audctrunk.aceducation.info
- Message Condition: #0 [Teams-Contact]

**ACTION Column:**

- Action Type: Allow
- Destination Routing Policy: --
- IP Group Selection: Source IP Group
- Source IP Group: #2 [Teams]
- IP Group Tag Name: default
- IP Profile: --

At the bottom, there are 'Cancel' and 'APPLY' buttons.

3. Click **Apply**.

## 4.13 Configure IP-to-IP Call Routing Rules

This section describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Teams Direct Routing and Pyur SIP Trunk:

- Terminate SIP OPTIONS messages on the SBC that are received from any entity
- Terminate REFER messages to Teams Direct Routing
- Calls from Teams Direct Routing to Pyur SIP Trunk
- Calls from Pyur SIP Trunk to Teams Direct Routing

➤ **To configure IP-to-IP routing rules:**

1. Open the IP-to-IP Routing table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Routing** > **IP-to-IP Routing**).
2. Configure routing rules as shown in the table below:

**Table 4-8: Configuration IP-to-IP Routing Rules**

| Index | Name                                | Source IP Group | Request Type | Call Trigger | ReRoute IP Group | Dest Type   | Dest IP Group | Internal Action         |
|-------|-------------------------------------|-----------------|--------------|--------------|------------------|-------------|---------------|-------------------------|
| 0     | Terminate OPTIONS                   | Any             | OPTIONS      |              |                  | Internal    |               | Reply (Response ='200') |
| 1     | Refer from Teams (arbitrary name)   | Any             |              | REFER        | Teams            | Request URI | Teams         |                         |
| 2     | Teams to SIP Trunk (arbitrary name) | Teams           |              |              |                  | IP Group    | Pyur          |                         |
| 3     | SIP Trunk to Teams (arbitrary name) | Pyur            |              |              |                  | IP Group    | Teams         |                         |

The configured routing rules are shown in the figure below:

**Figure 4-26: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table**

| IP-to-IP Routing (4)                                                                                                                                                                          |                |                |                           |                 |              |                         |                              |                  |                      |                           |                     |

| 2                                                                                                                                                                                             | Teams to SIP   | Default_SBCR   | Route Row                 | Teams           | All          | *                       | *                            | IP Group         | Pyur                 | --                        |                     |
| 3                                                                                                                                                                                             | SIP Trunk to T | Default_SBCR   | Route Row                 | Pyur            | All          | *                       | *                            | IP Group         | Teams                | --                        |                     |

**Note:** The routing configuration may change according to your specific deployment topology.

## 4.14 Configuring Firewall Settings (Optional)

**Note:** AudioCodes advised to configure firewall with network traffic filtering rules **in front of** WAN interface of the SBC. For detailed list of ports, which needed to be open please refer to: <https://docs.microsoft.com/en-us/microsoftteams/direct-routing-plan#sip-signaling-fqdns>.

As an extra security to the above note, there is option to configure traffic filtering rules (*access list*) for incoming traffic on AudioCodes SBC. For each packet received on the configured network interface, the SBC searches the table from top to bottom until the first matching rule is found. The matched rule can permit (*allow*) or deny (*block*) the packet. Once a rule in the table is located, subsequent rules further down the table are ignored. If the end of the table is reached without a match, the packet is accepted. Please note that the firewall is stateless. The blocking rules will apply to all incoming packets, including UDP or TCP responses.

➤ **To configure a firewall rule:**

1. Open the Firewall table (**Setup** menu > **IP Network** tab > **Security** folder> **Firewall**).
2. Configure the following Access list rules for Teams Direct Rout IP Interface:

**Table 4-9: Firewall Table Rules**

| Index | Source IP                                 | DNS Query Type | Prefix Length | Start Port | End Port | Protocol | Use Specific Interface | Interface ID | Allow Type |
|-------|-------------------------------------------|----------------|---------------|------------|----------|----------|------------------------|--------------|------------|
| 0     | <Public DNS Server IP><br>(e.g., 8.8.8.8) |                | 32            | 0          | 65535    | Any      | Enable                 | WAN_IF       | Allow      |
| 1     | 52.114.148.0                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 2     | 52.114.132.46                             |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 3     | 52.114.75.24                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 4     | 52.114.76.76                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 5     | 52.114.7.24                               |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 6     | 52.114.14.70                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 7     | 52.114.16.74                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 8     | 52.114.20.29                              |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 9     | 52.114.36.156                             |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 10    | 52.114.32.169                             |                | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 11    | sipaccount.pyur.tel                       | A              | 32            | 0          | 65535    | TCP      | Enable                 | WAN_IF       | Allow      |
| 49    | 0.0.0.0                                   |                | 0             | 0          | 65535    | Any      | Enable                 | WAN_IF       | Block      |

**Note:** Be aware, that if in your configuration, connectivity to SIP Trunk (or other entities) is performed through the same IP Interface as Teams (WAN\_IF in our example), you must add rules to allow traffic from these entities. See an example in the row of index 11.

## 4.15 Configure Number Manipulation Rules

This section describes how to configure IP-to-IP manipulation rules. These rules manipulate the SIP Request-URI user part (source or destination number). The manipulation rules use the configured IP Groups (as configured in Section 4.9 on page 36) to denote the source and destination of the call.

**Note:** Adapt the manipulation table according to your environment dial plan.

As an example, in this interoperability test topology, a manipulation was configured to replace the "+" (plus sign) with "00" (for international calls). This manipulation was done in the destination and source number for calls from the Teams Direct Routing IP Group to the Pyur SIP Trunk IP Group (and vice versa).

### ➤ To configure a number manipulation rule:

1. Open the Outbound Manipulations table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Manipulation** > **Outbound Manipulations**).
2. Configure the rules according to your setup.

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls between Teams Direct Routing IP Group and Pyur SIP Trunk IP Group:

**Figure 4-27: Example of Configured IP-to-IP Outbound Manipulation Rules**

| INDEX | NAME          | ROUTING POLICY | ADDITIONAL MANIPULATION | SOURCE IP GROUP | DESTINATION IP GROUP | SOURCE USERNAME PATTERN | DESTINATION USERNAME PATTERN | MANIPULATION ITEM | REMOVE FROM LEFT | REMOVE FROM RIGHT | LEAVE FROM RIGHT | PREFIX TO ADD | SUFFIX TO ADD |
|-------|---------------|----------------|-------------------------|-----------------|----------------------|-------------------------|------------------------------|-------------------|------------------|-------------------|------------------|---------------|---------------|
| 0     | Replace 00 b  | Default_SBCI   | No                      | Pyur            | Teams                | *                       | 00                           | Destination l     | 2                | 0                 | 255              | +             |               |
| 1     | Replace 00 b  | Default_SBCI   | No                      | Pyur            | Teams                | 00                      | *                            | Source URI        | 2                | 0                 | 255              | +             |               |
| 2     | Replace '+' b | Default_SBCI   | No                      | Teams           | Pyur                 | *                       | +                            | Destination l     | 1                | 0                 | 255              | 00            |               |
| 3     | Replace '+' b | Default_SBCI   | No                      | Teams           | Pyur                 | +                       | *                            | Source URI        | 1                | 0                 | 255              | 00            |               |

| Rule Index | Description                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | Calls from ITSP IP Group to Microsoft Teams IP Group with the prefix destination number "00", remove 2 digits and add "+" (plus sign) to the prefix of the destination number. |
| 1          | Calls from ITSP IP Group to Microsoft Teams IP Group with the prefix source number "00", remove 2 digits and add "+" (plus sign) to the prefix of the source number.           |
| 2          | Calls from Microsoft Teams IP Group to ITSP IP Group with the prefix destination number "+" (plus sign), remove "+" and add "00" to the prefix of the destination number.      |
| 3          | Calls from Microsoft Teams IP Group to ITSP IP Group with the prefix source number "+", remove "+" and add "00" to the prefix of the source number.                            |

## 4.16 Configure Message Manipulation Rules

This section describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 1) for Teams. This rule applies to messages received from the Teams IP Group. This removes the SIP *P-Asserted-Identity* Header.

| Parameter           | Value                      |
|---------------------|----------------------------|
| Index               | 0                          |
| Name                | Remove PAI                 |
| Manipulation Set ID | 1                          |
| Action Subject      | Header.P-Asserted-Identity |
| Action Type         | Remove                     |

**Figure 4-28: Configuring SIP Message Manipulation Rule 0 (for Teams)**

**Message Manipulations [Remove PAI]**

**GENERAL**

Index: 0

Name: Remove PAI

Manipulation Set ID: 1

Row Role: Use Current Condition

**ACTION**

Action Subject: Header.P-Asserted-Identity

Action Type: Remove

Action Value:

**MATCH**

Message Type:

Condition:

Cancel APPLY

3. Configure another manipulation rule (Manipulation Set 1) for Teams. This rule applies to messages received from the Teams IP Group. This removes the SIP *Privacy* Header in all messages, except of call with presentation restriction.

| Parameter           | Value                                                           |
|---------------------|-----------------------------------------------------------------|
| Index               | 1                                                               |
| Name                | Remove Privacy Header                                           |
| Manipulation Set ID | 1                                                               |
| Condition           | Header.Privacy exists And Header.From.URL !contains 'anonymous' |
| Action Subject      | Header.Privacy                                                  |
| Action Type         | Remove                                                          |

The table displayed below includes SIP message manipulation rules which are grouped together under Manipulation Set IDs (Manipulation Set IDs 1 and 4) and which are executed for messages sent to and from the Pyur SIP Trunk IP Group as well as the Teams Direct Routing IP Group. These rules are specifically required to enable proper interworking between Pyur SIP Trunk and Teams Direct Routing. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

| Rule Index | Rule Description                                                                                                                                                                                                                                                                                                 | Reason for Introducing Rule                                                                                                                                                                       |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0          | This rule applies to messages received from the Teams IP Group. This removes the SIP <i>P-Asserted-Identity</i> Header.                                                                                                                                                                                          |                                                                                                                                                                                                   |
| 1          | This rule applies to messages sent to the Teams IP Group. This removes the SIP <i>Privacy</i> Header in all messages, except of call with presentation restriction.                                                                                                                                              |                                                                                                                                                                                                   |
| 2          | This rule applies to messages sent to the Pyur SIP Trunk IP Group in a call forward scenario. It changes the prefix of the user part of the SIP <i>History-Info.0</i> Header from "+" to "00" and replaces the host part of the SIP <i>History-Info.0</i> Header with the value from the <i>SIP From</i> Header. | For Call Forward initiated by Teams Direct Routing. To implement Topology Hiding we replace the Host part of the SIP <i>History-Info.0</i> Header with the value from the <i>SIP From</i> Header. |
| 3          | This rule applies to messages sent to the Pyur SIP Trunk IP Group in a call forward scenario. It adds SIP <i>Diversion</i> Header with the value from the SIP <i>History-Info</i> Header.                                                                                                                        | This is required for the Service Providers who did not update their Soft Switches to support SIP <i>History-Info</i> Header (instead of the outdated SIP <i>Diversion</i> Header).                |
| 4          | This rule applies to messages sent to the Pyur SIP Trunk IP Group in a call forward scenario. It changes the prefix of the user part of the SIP <i>History-Info.1</i> Header from "+" to "00" and replaces the host part of the SIP <i>History-Info.1</i> Header with the value from the <i>SIP From</i> Header. | For Call Forward initiated by Teams Direct Routing, to implement Topology Hiding we replace the Host part of the SIP <i>History-Info.1</i> Header with the value from the <i>SIP From</i> Header. |
| 5          | This rule applies to messages sent to the Pyur SIP Trunk IP Group in a call transfer scenario. It changes the prefix of the user part of the SIP <i>Referred-By</i> Header from "+" to "00" and replaces the host part of the SIP <i>Referred-By</i> Header with the value from the <i>SIP From</i> Header.      | For Call Transfer initiated by Teams Direct Routing. To implement Topology Hiding we replace the Host part of the SIP <i>Referred-By</i> Header with the value from the <i>SIP To</i> Header.     |
| 6          | This rule is applied to response messages sent to the Pyur SIP Trunk IP Group for Rejected Calls initiated by the Teams Direct Routing IP Group. This replaces the method type '503' with the value '486'.                                                                                                       | Pyur SIP Trunk does not recognize the '503' method type and continues to send INVITE messages.                                                                                                    |

3. Assign Manipulation Set ID 1 to the Teams Direct Routing IP Group:
  - a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
  - b. Select the row of the Teams Direct Routing IP Group, and then click **Edit**.
  - c. Set the 'Inbound Message Manipulation Set' field to 1.

**Figure 4-36: Assigning Manipulation Set to the Teams Direct Routing IP Group**

The screenshot shows the 'IP Groups [Teams]' configuration window. At the top, there is a dropdown for 'SRD' set to '#0 [DefaultSRD]'. Below this, the window is divided into two main sections: 'GENERAL' and 'MESSAGE MANIPULATION'.

**GENERAL Section:**

- Index: 2
- Name: Teams
- Topology Location: Up
- Type: Server
- Proxy Set: #2 [Teams]
- IP Profile: #2 [Teams]
- Media Realm: #1 [Teams]
- Internal Media Realm: ..
- Contact User: (empty)
- SIP Group Name: sipaccount.pyur.tel

**MESSAGE MANIPULATION Section:**

- Inbound Message Manipulation Set: 1
- Outbound Message Manipulation Set: -1
- Message Manipulation User-Defined String 1: (empty)
- Message Manipulation User-Defined String 2: (empty)
- Proxy Keep-Alive using IP Group settings: Enable

At the bottom of the window, there are 'Cancel' and 'APPLY' buttons.

- d. Click **Apply**.

4. Assign Manipulation Set ID 4 to the Pyur SIP trunk IP Group:
  - a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
  - b. Select the row of the Pyur SIP trunk IP Group, and then click **Edit**.
  - c. Set the 'Outbound Message Manipulation Set' field to **4**.

**Figure 4-37: Assigning Manipulation Set 4 to the Pyur SIP Trunk IP Group**

The screenshot shows the 'IP Groups [Pyur]' configuration window. At the top, there is a dropdown for 'SRD' set to '#0 [DefaultSRD]'. Below this, the configuration is divided into two main sections: 'GENERAL' and 'MESSAGE MANIPULATION'.

**GENERAL Section:**

- Index: 1
- Name: Pyur
- Topology Location: Down
- Type: Server
- Proxy Set: #1 [Pyur]
- IP Profile: #1 [Pyur]
- Media Realm: #0 [SIPTrunk]
- Internal Media Realm: --
- Contact User: (empty)
- SIP Group Name: sipaccount.pyur.tel

**MESSAGE MANIPULATION Section:**

- Inbound Message Manipulation Set: -1
- Outbound Message Manipulation Set: 4
- Message Manipulation User-Defined String 1: (empty)
- Message Manipulation User-Defined String 2: (empty)
- Proxy Keep-Alive using IP Group settings: Enable

At the bottom of the window, there are 'Cancel' and 'APPLY' buttons.

- d. Click **Apply**.

## 4.17 Miscellaneous Configuration

This section describes miscellaneous SBC configuration.

### 4.17.1 Configure Call Forking Mode

This section describes how to configure the SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the SBC opens a voice stream according to the received SDP. The SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if a 180 response without SDP is received. It is mandatory to set this field for the Teams Direct Routing environment.

➤ **To configure call forking:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

**Figure 4-38: Configuring Forking Mode**

The screenshot shows the 'SBC General Settings' window with the 'GENERAL' tab selected. A black arrow points to the 'Forking Handling Mode' dropdown menu, which is currently set to 'Sequential'. The other settings in the window are: Direct Media (Disable), Unclassified Calls (Reject), No Answer Timeout [sec] (600), BroadWorks Survivability Feature (Disable), Max Forwards Limit (70), Max Call Duration [min] (0), No RTP Timeout After Connect [ms] (0), and Keep original user in Register (Do not keep user; 0).

| SBC General Settings              |                       |
|-----------------------------------|-----------------------|
| GENERAL                           |                       |
| Direct Media                      | Disable ▼             |
| Unclassified Calls                | Reject ▼              |
| Forking Handling Mode             | Sequential ▼          |
| No Answer Timeout [sec]           | 600                   |
| BroadWorks Survivability Feature  | Disable ▼             |
| Max Forwards Limit                | 70                    |
| Max Call Duration [min]           | 0                     |
| No RTP Timeout After Connect [ms] | 0                     |
| Keep original user in Register    | Do not keep user; 0 ▼ |

3. Click **Apply**.

### 4.17.2 Optimize CPU Cores Usage for a Specific Service (relevant for Mediant 9000 and Software SBC only)

This section describes how to optimize the SBC's CPU cores usage for a specified profile to achieve maximum capacity for that profile. The supported profiles include:

- SIP profile – improves SIP signaling performance, for example, SIP calls per second (CPS)
- SRTP profile – improves maximum number of SRTP sessions
- Transcoding profile – enables all DSP-required features, for example, transcoding and voice in-band detectors

➤ **To optimize core allocation for a profile:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. From the 'SBC Performance Profile' drop-down list, select the required profile:

SBC Performance Profile

• Optimized for transcoding ▼ ⚡

3. Click **Apply**, and then reset the device with a burn-to-flash for your settings to take effect.

**Note:** If your SBC is deployed in a virtual environment and transcoding is required, your virtual machine must have a minimum of 2 vCPUs. For more information, please refer to the appropriate Installation Manual, which can be found on AudioCodes website.

**This page is intentionally left blank.**

## A AudioCodes INI File

The *ini* configuration file of the SBC, corresponding to the Web-based configuration as described in Section 4 on page 21, is shown below:

**Note:** To load or save an *ini* file, use the Configuration File page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Configuration File**).
